OUTPUT:

The screenshot shows the Arduino IDE interface with a simulation window. The code on the left is for an ESP32 connected to an HC-SR04 ultrasonic sensor. It configures the sensor pins, sets up an MQTT client to connect to IBM Watson IoT, and publishes distance data. The simulation window on the right shows a circuit diagram with an ESP32 and an HC-SR04 sensor. Below the diagram, the console output shows the device sending payloads like {"distance":141.21,"object":"No"} and receiving responses like "no object found".

Data send to the IBM cloud device when the object is far

The screenshot shows the IBM Watson IoT Platform console. The top navigation bar includes 'Browse', 'Action', 'Device Types', and 'Interfaces'. A sidebar on the left contains various icons. The main content area shows a table of device events for a device named 'DISTANCEDETECT'. The table has columns for 'Event', 'Value', 'Format', and 'Last Received'. The events listed are all 'Data' events with a value of {"distance":141.21,"object":"No"} in json format, received a few seconds ago.

Event	Value	Format	Last Received
